Thanks for the links, yes I did try to created a new virtual server and it would not show the storage drive for me to select, it would only show the quorum drive, but I can see the storage drive in my computer, also the storage drive and the quorum are on the same disk just different partitions. I have tried un-installing but no success, when I run setup it ask for the virtual server I put in the one that I created and it gives me an error that virtual server already exist, I will try the manual un-install. Thanks for the timely posts.
