Platform: Window2003 ent Failover Clustering SQL Server 2k ent sp3a.

I need change some registry keys regarding to SQL, such as:

HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\MSSQLServer

Do I need change on all the nodes one by one?

Previously, after non-clustered default installation, I always referenced

<http://support.microsoft.com/default.aspx?scid=kb;EN-US;224071> and

<http://support.microsoft.com/default.aspx?scid=kb;EN-US;q240867> to Move SQL

Server databases to a new location.

However, I have new windows2003 SQL server 2k sp3a setup with external shared storage. I need relocate databases and full text indexes. I'm not sure which way I shall follow to moving database files or change registry keys.
