-

We have an issue in our environment that requires me to bounce a cluster group and associated services ever other day and Im getting tired of it (out of control developers).

I would like to create a script that I can schedule to do this and would like to know if there is a command line that will take just one cluster group offline and then bring it back online. I have under groups in my cluster admin: Cluster information, DataMirror, SQL Backup, SQL Data and SQL Logs. I need to bounce the DataMirror one.

Thanks!!

Derrick
