FYI, Security patch MS03-031 brings SQL up to build 818.

Also, you may have to run the setup program twice, depending on how you removed the old node. If you only evicted the node from the cluster and did not run the SQL setup, you will have to re-run the setup to remove the old node from the SQL configuration information. Once the old node information is gone from both SQL and the cluster configuration, you can follow the steps Uttam described.
