Hello,

All of our Intranet servers are physically moving from one datacentre to another. We have already catered for the front-ends, but I need to find out what needs doing to our clustered SQL Server 2000 environment.

We have a 2 node Win2k cluster, with SQL Server 2000 Enterprise Edition. The database files are stored on a miniSAN. We're physically picking up the kit, and moving it to another datacentre.

I need to know what considerations need to be made to bring the cluster back-up, database intact, once it's in the new datacentre.

Any suggestions/recommendations are gratefully received.

Andrew
