I haven't set up a failover cluster before and hope someone can help.

It is Windows 2003, SQL Server 2005 failover cluster. We have set up 2 nodes emrdb1 and emrdb2, cluster name is emrcluster.

Do we need to add SQL Server Agent as a resource?

How do I set up physical disks? I need C:, E:, F:, G:, I:, J:, and Q: drives for data and transaction logs. They are created on both nodes. Do I just add them as new resources? I tried this and some of the disks are not available as a disk parameter choice, and a few are all lumped together, I can only select: I: (CDR_Log)J:(MSI_Logs)Q:(Q4Quorum) all together.

Where is that info coming from, can I correct it somehow?

Also what dependencies should they have?

THanks for any ideas!
