Dear Edwin,

Are you saying the traffic is re-directed to the physical server that is owning the cluster.

Regards

Balaji

It does not for W2003, as it does not have to:

the IP address (in the resource group) goes offline, and comes online on the second node... it still is the same IP address, problem solved

(this works differently when you are talking about W2008, multi-site, and on different IP subnets)

Dear All,

On a failover cluster, how does windows redirect the traffic to correct physical machine when the clients connect to the virtual network name.

Regards

Balaji
