Hi everyone,

I would really appreciate if anyone could tell me what is happening with OLEDB provider.

I have a stored procedure which inserts data into IBM DB2 tables using a linked server, the linked server uses OLE DB provider 'IBMDADB2'. I ran the stored procedure a couple of days back and i was able to insert 250 records in a batch. But today when I tried to insert 200 records in a batch, the stored procedure was able to insert only 100 records and the Job failed with the following reason

Executed as user: ENT\pacesql. OLE DB provider 'IBMDADB2' reported an error. The provider ran out of memory. [SQLSTATE 42000] (Error 7399) OLE DB error trace [OLE/DB Provider 'IBMDADB2' ICommandText::Execute returned 0x8007000e: The provider ran out of memory.]. [SQLSTATE 01000] (Error 7300). The step failed.

I then tried calling the stored procedure from Query Analyser but it gave me the same error. After re-creating the linked the Job ran fine and was able to insert the remaining record.

I was wondering if anyone here faced this problem or does anyone know why this is occurring and if anyone could point me when to find a solution to this problem i would really appreciate it.

Thanks in Advance.
