I just recently got it fixed.

I ran Spybot and Ad-Aware on the client pc (both with the latest updates). I think that I had run Spybot before, but not Ad-Aware. The pc was loaded with suspect stuff. I knew that it shouldn't have been a permissions or application problem, because the user didn't have a problem on other pc's and other users didn't have a problem on their pc. My theory is that something was redirecting them no matter what action they took.
