Found out the following:

Trying to create a dataconnection by VB6, no result, same error.

The same with VS.net, no result, same error.

This has to be a server issue, untill..... I tried with FrontPage 2003 via the wizard to create a dataconnection and succes.

Now I am back: this should be an issue of the clients ??? But what/where ???

So take it all together:

Apps InfoPath2003, VB6, VS.net cannot create a dataconnection to SQL2000 via the wizards !!

Apps SharePointSites, FrontPage2003 can create !!

Help is appreciated,

Ger.
