Dear all,

I am new to SQL server 2005.

I have a connection problem when I connect from home client to office server through VPN.

Firstly, I can connect from office client to office server, both database engine and analysis server, with Windows authentication. I log in the office client box with a domain account (domain\userid), and the office client and the office server are both known to domain.

1.Windows authentication

My home client box is not known to the domain, but I can ping the office server, I created a local userid on office server and tried connecting with Windows authentication (the same userid/password on the home client login) The following error in SSMS: login failed for user ". The user is not connected with a trusted SQL Server connection. (Microsoft SQL Server Error: 18452)

2.SQL Server authentication

I created a userid/password in server side SSMS -> server -> security -> logins and I tried connecting from home client, the same error in SSMS: login failed for user ". The user is not connected with a trusted SQL Server connection. (Microsoft SQL Server Error: 18452)

My home client is a Windows XP Pro, and I checked the firewall is closed.

Any comments are highly appreciated.
