We recently upgraded our SQL 2000 SP3 instance (running on Windows 2000) to SQL 2000 SP4 running on Windows Server 2003 SP1. The migration went fine but we are now experiencing a problem where connections are not dropping once the application is finished with it. The application is a COM+ app making an ODBC connection, which then never closes. We are running a job that cleans up the connections, but we can't seem to find the reason why SQL is keeping the connections open in the first place. Any ideas or suggestions?

Brad
