You can also try by Start -> Run -> cmd
and then write the comand
telnet <server_name> <port_number>
this will run telnet. If screen goes black and cursor will show you have acces to the server.

Where Can I find microsoft telnet tool? I tried to find microsoft downloads
but I didn't find.

Could you help me?

Thanks

"Manikanth" wrote:

You can use a microsoft telnet tool to find out whether you can telnet into
the destination server on a particular port. On the destination server side,
do a netstats to find out the list of portnumbers that are already being
used.

By default, 1433 is the port no that sql server listens on. You can change
it using server network utility. However
when the client tries to connect, make sure that the client network utility
is also configured with the port number changes.

thks,
Mani
