Can you please help me to out from this problem?

You've posted it on the wrong group. This group is for connection issues, not data issues. I suggest that you repost in a more appropriate group.

Problem detail:

We have two table A and B (e.g.). Table A is parent of Table B. In PB, system deleting one row from table B using datawindow control, who parent data present in Table A and in the same transaction system is calling one stored procedure before calling dw_1.update method. In that stored procedure system is trying to delete parent data from Table A.

We are getting referential integrity error since we started using PB 11 with SNC SQL Native client. It was working fine upto PB 9.0 version.

Okay, what is "PB"? PowerBuilder? You should post this in a group for the tool that you are using, since it sounds like it might be related to that. I will tell you, however, that you must delete the rows from table B before deleting the related rows from A.

I think, I would not give clear idea about this issue. let me puting it in differant way.

As I mentioned in my first post, in same scenario the application is running in PB 9 with MSS driver. I have migrated same code in PB 11, I am getting error message as i have mentioned above. could please let me whether any Parameter is required set so that this issue get solve? Please help me
