Hi there,

I would like to know if this is a usual practice to having an ETL able to cancel (rollback) the move of data that has been done into a destination.

In other words, after having inserted data into a destination, can we go back to a previous state?

Is that common to do that? How to do that? What do we need to consider before implementing such a feature? What tools/solutions are available to activate this feature?

I personally use MS SSIS as an ETL tool

Thanks,

Christophe
