I have created a package with multiple task that I would like to rollback if an error occurs. I did this on the development server with out a problem by going in the configuring the workflow properties of the tasks. However, when I moved the packages into production I get the following error:

Connection '<connection name>' for Task 'DTSTask_DTSExecuteSQLTask_1' does not support joining distributed transactions or failed when attempting to join.
New transaction cannot enlist in the specified transaction coordinator.

Production is a active/passive cluster and I verified that both servers have DTC up and running. Don't anyone have an idea what is causing this?

Thanks in advance,

Randall
