Looks like the install package I built will not work for DTS Tasks. I uninstalled the installed package and then copied everything over to the server and manually registered all the components and now it is working for both IDs. So much for an automated install routine.

If I log into the machine using my account and manually open and run the package, everything works. If I log in and use the limited SQL Server account, the task will not show up when creating a new package, the saved package opens with a "Invalid Class String" and trying to run the task gives the same thing.*
