Helge:

Thanks for the reply. We are running under Win2k3 with SP1 installed and then uninstalled (created a unforeseen problem on the server). Job ran fine for about a week and then started giving errors. Yes, this one uses a lookup, which I'd like to follow Microsoft's advice for a workaround to "not use lookup queries in DTS packages" but I'd like to see them do what I am without the use of one. We have got it working again by rebooting the server. The reason we started this job was because a previous one began failing right at the end with Microsoft .NET crashing on cleanup. Everything ran fine, but it kept reporting a failure because of cleanup problems. Rebooting the server fixed that one so we have moved back to using it instead of this one. And, yes, it is using a lookup without problems. Difference between the two jobs is as follows:

Job in question is one Job with 6 steps. Each step executes a separate DTS package.

Job now running is one Job executing one DTS Package that executes 6 DTS packages.

Sounds like Microsoft doesn't even understand what fixes the issue. Lookups work fine as long as not executed directly from a job. Must call the lookup package from another package for it to work. We would never have gotten this error has .NET not started messing up.

Scott
