The error 80004005 would suggest either permission problems or that the thing for which you look does not exist.

This is from BOL.

xp_cmdshell operates synchronously. Control is not returned until the command shell command completes.

When you grant execute permissions to users, the users can execute any operating-system command at the Microsoft Windows NTR command shell that the account running Microsoft SQL ServerT has the needed privileges to execute.

By default, only members of the sysadmin fixed server role can execute this extended stored procedure. You may, however, grant other users permission to execute this stored procedure.

When xp_cmdshell is invoked by a user who is a member of the sysadmin fixed server role, xp_cmdshell will be executed under the security context in which the SQL Server service is running. When the user is not a member of the sysadmin group, xp_cmdshell will impersonate the SQL Server Agent proxy account, which is specified using xp_sqlagent_proxy_account. If the proxy account is not available, xp_cmdshell will fail. This is true only for MicrosoftR Windows NTR 4.0 and Windows 2000. On Windows 9.x, there is no impersonation and xp_cmdshell is always executed under the security context of the Windows 9.x user who started SQL Server

Re: Executin DTSrun Utility under the xp_cmdshell

I am attempting to execute a DTS package from Query Analyzer using the DTSrun utility under xp_cmdshell. When I execute the package, I receive the following error:

```
"DTSRun OnError: Copy Data from Results to  
J:\IDEAS40\TRISQL44\MJE\Data\MJE065d.txt Step, Error = -2147467259 (80004005)  
Error string: Error opening datafile: Logon failure: unknown user name  
or bad password."
```

However, when I excute the same package under a DOS prompt, the package executes successfully. The same is true when the package is executed via Enterprise Manager. Can someone help?
