I have a DTS package I am kickig off from a C#.Net aplcation that imports a tab delimited text file created by the C# app. I can successfully kick off the DTS package from my development machine, run the package, and everything works great.

When I install the app on another machine, it successfully kicks off the DTS package, but the package fails to find the text file to import. I am pretty sure this is some kind of permissions issue. I am using SQL Server security rather than widows security on the login to the SQL Server. The file name is referenced using the UNC filename (although I have also tried the direct path to the filename on the server with the same result). Any ideas why this would perform differently on two different machines? What security account does a DTS package kicked off from a client machine run under?

Thanks in advance for any help.

.
