Hi There,

I have around 10 DTS jobs which run every night. These jobs basically copy data from views of a source DB to tables in a target DB. These jobs have been failing quite frequently in the recent past. I have checked and there are no constraint violations (like primary keys) in the target DB. Most of the times I just start the job again and it runs successfully.

The DTS job history does not give me any details and it says it exits by code –1. I read online and have enabled SQL logging for the DTS jobs today.

I want some suggestions if there are any best practices while creating these jobs. And can you suggest what are the common reasons why DTS jobs fail?

Thanks a lot for your reply!
