Thank you for pointing that out, Allan. The driver was the problem. I'll post my answer here in case anyone else needs to know what my particular problem was.

I found out the Oracle driver they had installed on my system was for Oracle 8. Which is fine – it's an Oracle 8 database. However, my system is running on Windows XP. The Oracle 8 drivers were designed for NT. So while the Oracle 8 Client would work fine, the ODBC for some reason didn't agree with DTS.

I found out we had a copy of Oracle 9i as well. I installed that client, and connected to the Oracle 8 database fine with it. But with that, it also allowed me to install a more recent Oracle Driver I downloaded from their site (They have some odd way of installing things – you need a special installer app in order to install their ODBC's.. Bleh).

This time it connected, and worked like a charm.

Just as a warning to all others with the problem – Check your drivers!

Hello Adam,

I can think of a couple of things I would try

1. Make sure you are using the latest version of the driver.
2. Make sure that the name of the tables do not contain any funnies like periods.

Re: DTS for Oracle through ODBC: Error Calling GetNextRows in Prev

Hello again, everyone!

I'm attempting to create a DTS package to migrate data from our old Oracle 8 system to SQL Server 2000.

I decided to use the Oracle ODBC provided in their client install. The Microsoft ODBC Driver for Oracle, for some reason, doesn't see all the tables when you attempt to proceed, although it does work fine on the ones it can. (That's another question: Why can't it see them all? It also, oddly enough, sees most of the "tables" as views.)

So the Oracle ODBC lets me see all the tables just fine. I selected one to test, and select preview, and then I receive the following error:

Context: Error calling GetNextRows. Your provider does not support all the interfaces/methods required by DTS.

So, my questions are these:

- 1) Has anyone ever encountered this error before? If so, how did you resolve it?
- 2) Is there an update for the one provided by Microsoft that would let me see all the tables?

Thanks for your help!
