This is not a bug. It is by design. MS started getting more secure and this is a side benefit(?).

Since you are using SQL 2005 or 2008 and BIDS, you are using SSIS, not DTS, correct?

Try this: Open a package and look at the package properties pane. look for an entry "Package Protection Level".

Hi,

I work with Sql Server Business Intelligence Development
I import a DTS coming from SQL 2000 server and the importation work with succes

Now I want to edit a connection that is in the connection manager
I try to use a Sql Server Authentication and I click the radio button save Password
I test the connection and the connection succes
I click OK and close the Connection Manager Window

When I try my DTS that use the connection, the connection failed
I open the Connection Manager for that connection and I realize that the Connection Manager did not save my password even if I click the radio button Save password

Is that a bug or am I doing something wrong?

RE: Password dont save in Connection

If I use the Windows authentication it works well but I would prefer to use Sql Authentication because when I will release those DTS to my client server I dont want to have to edit every DTS.

Do you have and idea of how I can get through this problem?

Thanks in advance I have a nice Day!
