Emil,

Since your customer has already applied SP4, I'm assuming that this is a SQL Server 7.0 installation as there currently is no publicly released SP4 for SQL Sever 2000.

For SQL Server 7.0 installations, there is a registry key and value that you can change in order to successfully re-install SP4 after applying a post-SP4 hotfix. Specifically, registry key called

HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\MSSQL Server\Current Version\
"CSDVersion"

It will contain your hotfix build version number such that 7.00.xxx is the build number. Record this value and then change it to the SP4 build value of 7.00.1063 and then re-install SP4. If successful, then re-install your hotfix and confirm that this registry key value has changed back to your recorded hotfix build number.

BTW, the hex value in the unknown result below is a 'garbage' value as this is a bug with SQL Server 7.0 FTS and is fixed by applying (or re-applying) the latest service pack.

Regards,

John
