Hi Joe,

I ran some queries to determine if there were any blocking processes at the time and none showed up. Also, the number of locks was normal, nothing out of the ordinary.

Kev.

Hi,
Experiencing a problem whereby a jdbc connection seems to become stuck while executing a prepared/callable statement (and does not return from the call).
The connection will then throw an SQLException some time later reporting a Connection Timed Out error. It appears to be random and does not consistently fail on the same area of code.
Also, is there a way to set a connection timeout that may help with this?

SQL Server 2005 SP1

Anyone else experienced this problem or has any ideas?

Re: connection timeouts

Cheers.

The first thing you'd want to look at is at the DBMS. You'd want to find out what the DBMS thinks is going on with that connection. It might be that your statement's SQL is blocked by locks in the DBMS that are being held by another process.

Ok, I would double-check, and verify what the DBMS thinks specifically is being done by the JDBC connection. If the DBMS says there is nothing at all being done, then there's a complicated problem. What version of the JDBC driver are you using?
