If you're new to MSDE, you'll find it much easier to administer if you purchase the SQLS Developer edition (\$49 U.S.) and just install the client tools. Or alternately install the full version and just use MSDE for deployment. You'll then be able to configure and administer security using the Enterprise Manager GUI instead of wrestling with command line utilities. Configuring asp.net security correctly can be tricky -- you might want to download the "Building Secure ASP.NET Applications" whitepaper (it's really more like a book) but it covers all of the angles, including accessing SQLS:
