I have created an Alert Message in MSDE 2K,, installed on Windows XP and when I type Raiserror(14599,10,1), the message appears in Message Window of Query Analyzer, while I need to display it outside the Query Analyzer using Windows Messaging Service, how can I do so, and what am I missing ?

Any example of T-sql will be appreciated.

Further, can I display my table field data in above message, for example:  
Invoice No. FL/2345 does not exist!

Best Regards,

Luqman
