I thought I have successfully restored a backup from another instance of MSDE, however in my .NET program I am getting an error message about the login failed. So what I did is create a login id using sp_grantlogin. I assume that this allows my Windows login to be authenticated. Just in case, I also added a new login account using sp_addlogin. Those both worked.

Now when I do...EXEC sp_grantaccess to the database, I get an error:
Database cannot be opened. It is in the middle of a restore.

When I was restoring, I did the RESTORE FILELISTONLY to get the names of the files in the backup. I then did RESTORE DATABASE using WITH and MOVE which announced it was successful, and the two files were placed into the directory. I thought this was it, what did I miss?

Thanks,

Brad
