I'm running MSDE 2000 SP4 on Win2KAS SP4 (fully patched). I have a maintenance plan that backs up the database at 18:30 and backs up the transaction log at midnight. Apparently the transaction log backups have been failing because the database is set to the Simple recovery model. More importantly, I'm losing updates to records that were updated prior to the database backup! The inserted records are still there, but the updates appear to have been rolled back (at least in one table where I've verified the problem.) I'm running some more checks now and I've set the recovery model to Full, but I'm interested in knowing if anyone else has seen anything like this before.
