I have an existing query in Access 2000 that I'm converting to a SQL view. One of my returned columns current syntax is:

```
Format([tblFoo.NoteAmount], "00000000.00") AS NoteAmount
```

If I give it a value of 10400.56 it will give me 00010400.56 as NoteAmount in the resulting data set.

If I give it a value of 94.00 it will give me 00000094.00 as NoteAmount in the resulting data set.

I can't seem to port this to a view. the "FORMAT" function isn't allowed and I can't get the NoteAmount which is a Float data type to cast or convert the way I want it.

Any ideas?
