I am getting an error on an ASP page that does a simple update to a single row in a table. The SQL statement is:

```
UPDATE tblRecHead SET Qty = 1 WHERE SeqNum = 123 and  
LineNumber = 12
```

The ASP page will time out and return an error. If I change the SQL to:

```
UPDATE tblRecHead SET Qty = 1 WHERE SeqNum = 123 and  
LineNumber = 12 and 1 = 0
```

Obviously, nothing is updated, but the SQL is executed without a problem. If I attempt to update the record in QA, using the first SQL statement, it works fine. There is an index on SeqNum,LineNumber.

Another thing to note is that a select is done prior to this and it returns data. Also, if I convert the first SQL statement to

```
SELECT * FROM tblRecHead WHERE SeqNum = 123 and  
LineNumber = 12
```

This returns one row.

Any ideas anyone?? Any help will be appreciated.

Larry...
