You could be hitting an MDAC bug where the authentication mode setting is ignored and windows authentication is always used. Refer to:

FIX: SQL Server ODBC Driver Ignores Authentication Setting  
<http://support.microsoft.com/?id=279526>

You can use component checker to verify the version and MDAC installation on any of the clients. You can download component checker and MDAC versions from this site:  
<http://msdn.microsoft.com/data/ref/mdac/downloads/>

Hi, I've a Access 2003 program with linked tables to a sqlexpress configured with mixed mode security.

From clients XP no problem.

From clients 2000 MSACCESS don't get the right configuration from ODBC

source, because try to conect with Windows Authentication Mode security, but the source is configurated with mixed mode. If I refresh the linked tables and change the password, works fine, but when I close MSACCESS and open again, fail.

Anybody knows where's the bug? In ODBC driver? MSACCESS?
