Well...it's an error on one of the connections, not sure what else to tell you. If DSNs are the same, maybe drivers are missing on one of the boxes. You could try using Access as a middle piece between the two data sources.

Thanks Sue,

I dropped the tables from the database and that took care of the table already exists message. But I still get the Source Name not found error. The SQL server 2000 being used to create the dts package is on a different computer than the MSDE. The dsn's are the same on both computers.

(I've also tried backing up the SQL master database and then restoring it on the MSDE master database but the message is that you cannot restore a SQL database to MSDE.)

Can I create a dts package without using SQL 2000 Enterprise manager? Or put another way how can I transfer ODBC dbase data to MSDE without using SQL 2000?

Thanks,
Charles.

Charles,
On the first error, if you have a DSN for your connections, you need to have that on the box where the DTS package is

Re: Help with dtsrun and dts package.

running. The problem is generally from having something in the connections that you had setup on the box where you developed the package but it is missing from the location where the package is running.

In terms of the second error, you are importing the data into a table named ITEMS. The task is set to create the table. If you run the package more than once against the database, the task is trying to create the table again but the table already exists. You need to modify the task to check for existence, truncate the table if needed. Or just create another Execute SQL task to drop the table before executing the task to populate the table.

Hi Sue,

The 2 types of errors I get are:

DTSRUN OnError: Copy data from ITCOUNT to
[master].[dbo].[ITCOUNT]
Step,Error=-2147467259 (80004005);
Error String:[Microsoft][ODBC Driver Manager] Data
source name not found

and

no default driver specified.

and

DTSRUN OnError: Create Table [master].[dbo].[ITEMS]

Step,Error=-2147217900

(80040E14);
Error String:[Microsoft][ODBC SQL Server Driver][SQL
Server]There is

already

an object named 'ITEMS' in the database.

Thanks, Charles.

Okay...so now the package runs but the package itself has errors. What exactly are the errors?

Sue, thanks for your response. The first problem was the /S etc.. I

thought

you had to specify the Server and Username.

Dtsrun now runs but I am getting errors.

'All' I want to do is to export data from an Microsoft ODBC dbase

database

to MSDE. What I have done is create an SQL database, imported the odbc dbase

stuff

into it, and now I am trying to export this new SQL database to a

structured

file dts package and import it into MSDE.

Is there a way that this can work? or is there an easier more direct

Re: Help with dtsrun and dts package.

way?

Thanks,
Charles.

You want to
use the /F
option
instead /S
/N etc and
then put
in the file
name with
full path to
the DTS
structured
storage file.
Something
along the
lines of:
dtsrun
/F"C:\SomeFolder\SomePackage.dts"
