Hi. I need urgent help in designing appropriate dimension and cubes for the following scenario

I have the following tables

Table : Orders (OrderId, EmailId, OrderDate, ShipDate, Status, ...blah..blah.....)

Table: OrderItems (OrderId, OrderItemId, OrderItemPrice,...blah blah)

Table: OrderPricing (OrderId, TotalOrderPrice, DiscountCode, DiscountPrice, ...blah)

Table: Users (EmailId, UserName, address, UserType,.....etc)

The above tables have more than millions of transaction records over years.

I have to build the following

1. Number of Order Sales figure by customer (email, and by over period)
2. Average Order Sales for any given range of dates by each user (email)
3. Total Discount Availed by customer wise and by any period wise...etc etc

and many more situations like that.

I would appreciate if some one could point out how to design the appropriate dimensions and cubes for this scenario

Thanks in advance

Siva
