Why don't you make this a business rule in the ETL? The only reason I bring this up is because I have a similar problem and it unfortunately increases the overall complexity of the cube to have to "fake" values.

Is there any way to convert a NULL to a 0 in either an MDX calculated member or otherwise without creating a value for members that would otherwise be empty. I have several hundred employees, only a few of whom create revenue. I don't want the others to show. There are however several consultants who have NULL or 0 revenue. When I try to convert the NULL to a zero (using IIF expression) I return all of the other employees as well. I'm trying to avoid having to using Reporting Services expressions to convert NULL's to zeros and manage less code.
