I've installed AS2005 32 bit version on a 3.8G xeon 4G RAM and restored the OLAP database.

There changing/saving a role takes 3sec!!!! On the 64 bit machine 2 mins!!!

What can it be ?

Thanks, Radu

My setup:

dual xeon dualcore 2.8 x64 8G RAM, SAN, Win 2003 Standard x64 , SQL2005 EE x64 + AS 2005 x64, SP 1 + post SP1 hotfix.

I have some OLAP databases (5) installed on the AS server which are working good. The problem is that when I change something in one database (role|deploy) the whole AS2005 is somehow locked!!!

The save process for a role can take up to 2-10 mins in one database and in the meantime all other databases are locked! no query is working, no connection with the management studio from other users to AS is working. The processor is 12.5% (1 exec unit: 100%, 7exec units: 1%)

I understand that the database on which I save the changes *can* get locked during the process but, why the *others* databases get locked also????!!.

The settings of the server (AS) are the default one.

This is a productive system and when I change a role the whole system freeze until the saving is finished, even if the role is made in a TestOLAPDB where I have the only access.

Does anyone have such problems? Do you have AS2005 databases with more than 150 roles on prod. system?

Re: AS2005 ... what is wrong with it?

Does anyone have any idea?

Thanks,
Radu
