Hello,

I'm a new newbie, so I apologize in advance...

I have a fact table with about 1.3M rows and three dimension tables (one of them is about 80,000 rows, the others only 1000). When I use the browser and add a few hierarchies to it, it gets really, really slow to display. It may take up to 2 minutes to refresh (I have a gig of ram with a 3.2 GHz P4, Windows XP Pro).

I ran the Design Aggregation Wizard (I selected Molap), it makes one partition with 70 aggregations (is that good?). When I change the percent or use the "Run Until I Hit Stop" it still gives me the same results.

What can I do to improve the performance? Do I break it into additional partitions? Am I missing a critical step (it sure feels that way)?

Thank you for the help.
