nytime you specify \\servername\shared through xp_cmdshell, NT permission is check. If the user is a sql admin then the account used to start sqlserver service will be used for authentication. If the user is not a sql admin, sql proxy account is used.

http://msdn.microsoft.com/library/en-us/tsqlref/ts_xp_aa-sz_4jxo.asp

Since you're specifying c\$, an NT admin account is needed to access the data. That means the sqlserver service account or the proxy account must be an NT admin on the \\server you're trying to access.
