Hi

i have a problem at hand can anyone help me out?

i have a table which contains rows . i want to create another table at runtime that has as its columns the row of the prev table. the number of rows are determined at runtime as such the columns are determined only at runtime.

for example

i have table called MSP\_Number\_Fields in Microsoft Project Server2003 database

i want each row of a particular column(Num\_field) as column for another table that will be created at runtime.

the no of rows are determined at runtime.

plzzzz help me
