I'm working in an environment where I am using stored procedures as the application's interfact to the database. The users have no direct rights to the underlying tables. Now I am tring to create a dynamic query. Ofcourse, this doesn't work because of the right issue. The query should return 1 or more columns based on the input (up to a couple dozen columns), and the where statement is also dynamic.

I've considered setting up a view, and giving 'select' access to the proper roles, but this just doesn't feel right...

Any thoughts?

Eric
