Hello Gurus,

I have a rather strange problem,

I have a stored procedure that I call from an ASP page, when I call it, it takes about 10–15 seconds to execute and return, however that same stored procedure executes and gives the result in Query Analyzer in at most 1 second!

Here is the killer, after I run the ALTER statement on the stored procedure from Query Analyzer(i don't change anything, i simply execute the ALTER script), that procedure will be just as fast from my ASP page!!!! This will last only until I reboot my machine.. after the reboot, the problem starts again!

Can someone please help me,

Thank you in advance...

Aslo, please post your replies in the News Group, as I no longer monitor the e-mail google@henok.com

Thank you,
