SQL Server 2000

master.dbo.xp_fixeddrives stored procedure is reporting different values when executed by 'sa' and a regular user.

Results:

(When executed by 'sa')

drive MB free

C 18432

D 118784

E 16384

(3 row(s) affected)

(When executed by 'UserA')

drive MB free

C 8192

D 68608

E 3072

(3 row(s) affected)

Is there any reason for this difference?

Thanks,

—payyans
