Hi Group,

I have two tables in SQL Server.

Table one is called Category with fields :

CategoryID and CategoryName.

Table two is called SubCategory with fields:

SubCategoryID

CategoryID

SubCategoryName

In Table one I have say 2 categories, Birthday and Easter.

In Table two I have 2 sub categories of Male and Female which are sub categories of Table ones Birthday entry.

What I would Like to return (if possible) using an SQL statement is the following:

Birthday

Male

Female

Easter

i.e. first the MAIN category, then the sub categories for that main category then onto the next category etc etc.

All the queries I have tried failed miserably! Is there any sql gurus out there that can point me in the right direction?

Many Thanks

Reapes
