Hi Mjuricek,

I looked into it a few times over the last days, but I simply don't have enough information to know what the script does. And a suggestion based on guesswork won't help you anything.

Please post the following:

1. Table structure of all tables that are relevant for the problem, posted as CREATE TABLE statements. Include all constraints but exclude irrelevant columns. See <http://www.aspfaq.com/etiquette.asp?id=5006> as well.
2. Sample data that illustrates your problem. Post the data in the form of INSERT statements. Test them before posting: create an empty database, run the CREATE TABLE statements mentioned above, then the INSERT statements. Correct errors, then post. See <http://vyaskn.tripod.com/code.htm#inserts> as well.
3. Expected output, based on the sample data you gave.
4. A short and concise description of the business problem you're trying to solve.

Best, Hugo
