I am wondering if Full Text Indexing is supported with MS SQL Server 2000 Developer Edition on XP Pro SP2 . I have the service installed and setup. I have created several catalogs with data but when they are done populating they show up with an Item Count of 0 and a Unique Index of 1 despite the fact that there are 10+ records with extremely different data in the 3 columns that are being indexed.

I am not seeing any unusual messages in the Event Viewer also. I have uninstalled and reinstalled already and the Server is running under an Administrator User

Reposted because it seems like .server is inactive or Outlook just refuses to poll it for messages
