OnUpdate-type event notification for SQL Server tables?

I'm looking for advice on the best way to monitor a specific SQL Server 2000 table for changes from an external application. I'll be writing this app in either C#/.NET or VB/ASP.

Obviously I can monitor the table for changes by polling once per interval (1 second here). I was hoping SQL Server has some kind of event notification system I can hook up to so that I can avoid the polling.

Any thoughts are appreciated!
