I've two machines (Linux Servers) with firewall installed at two geographical locations. Now I want to make replication of data using sqlserver2000 from two other machines which are behind the two servers . Both of them have private IP address and they can access the internet through the firewall . Now I have enabled the ports 1433 on both sides and had given the IP address of the receiving machine at the sending machine (Public IP at the network client –alias TCP/IP protocol) and vice versa. Proper mapping of IP (public to private is done ) at the two servers.

But still I'm getting the message, Failed to register the Sql Server

Pl help
