Hi,

I have the following setup, SQL1 and SQL2  
These server are windows 2003 and sql 2000 and both located in different offices connected by a 100MB WAN link. I have successfully created Transactional replication for failover....If SQL1 the publisher goes down, users will be redirected to SQL2 the subscriber....how will users be able to update this database (subscriber) and then send those changes back to the Publisher...I know merge does this but only SQL1 will be active...SQL2 is merely for DR purposes or failover.....Please advise...

Thanking You  
Elvis
