Please note the users have the MSDE installed on their pc, therefore thier is no enterprize manager or client network utility. Can they do a command from OSQL to create an alias, but even if they can, i dont think all users are smart enough to do this even if instructed.

I also read that alias to ip address can be programmed in subscriber replication coding.

This was in one of the http sites posted in replies to this thread, but it does have code examples.

"Use ActiveX Controls to pull your subscription. ActiveX Controls have programmatic methods which allow you to create an Alias without having to register the Publisher in Client Network Utility."

Does anyone know do to go about coding the alias piece.

thank
Sushil

Either use client network utility to build an alias on each subscriber or use the control properties publishernetwork and tcpip_sockets and then for publisheraddress enter the ip address, do the same for distributornetwork and distributoraddress

I have developed a windows vb.net application which reside on users laptop and uses data from local msde database. From time to time the users can connect to a main sql server via VPN and do a merge replication with subscribtion invoked from their windows application. Problem is that the main server can only be connected using an ip address. Can ip address be used in windows vb.net program as PublisherServer instance instead of the servername.
