I am able to find the PublisherID in almost 10 tables in SQL 2000.

Why am I not able to find the table that links the PublisherID to the PublisherName?

For example, I can see that PublisherID 1 is making the XXXDatabase available for replication, but who the heck is PublisherID 1 (i.e. the server name). I can use this in several custom queries, but I'm unable to find that table. I appreciate any help. I do see other tables where the name of the agents have the servername incorporated into them. Is it right in front of my eyes????
